## SUMMARY

Full-stack engineer with 9+ years shipping web and SaaS products, solo or as the senior on small teams. I've built a HIPAA-compliant healthcare platform and real-time market-data dashboards, and I work across the whole stack, including AI integration and computer vision, with published research papers.

## TECHNICAL SKILLS

**Languages:** C#, C++, Python, JavaScript, TypeScript, Kotlin

**Backend:** ASP.NET Core, EF Core, SignalR, Node.js, Bun, NestJS, FastAPI, ElysiaJS

**Frontend & Mobile:** React, Next.js, Angular, Blazor, Tailwind CSS, Kotlin Multiplatform, .NET MAUI, React Native

**Data:** PostgreSQL, MS SQL, MongoDB, Redis, Firebase, DynamoDB, Prisma

**AI/ML:** PyTorch, TensorFlow, OpenCV, YOLO, Claude/GPT/DeepSeek APIs, MCP, agentic workflows

**Game Dev:** Unity, Godot, PhaserJS, Colyseus, Metamod:Source 2

**Cloud & DevOps:** AWS (Amplify, S3, Lambda, Cognito), Azure, Docker, Kubernetes, GitHub Actions

## EDUCATION

**Northeastern University**, M.S. in Computer Science, Boston, MA

Jan 2024 – May 2026

**Suffolk University**, B.S. in Computer Science, Boston, MA

Sep 2021 – May 2023

## PROFESSIONAL EXPERIENCE

**Senior Software Engineer** | [EmTech Care Labs](#) | Portland, ME

Jan 2025 – Jun 2025

- Sole senior engineer on a HIPAA-compliant platform that helps families coordinate Alzheimer's care, used by 200+ caregivers and patients on AWS, with real-time messaging, push notifications, and shared care plans.
- Made the platform audit-ready for healthcare data: encrypted patient information, full audit logging, and role-based access control. It passed an outside HIPAA readiness review with no critical findings.
- Merged three separate web and mobile codebases into one TypeScript monorepo with a shared component library, so new screens stopped being rebuilt three times and the apps finally looked consistent.
- Worked directly with clinicians to scope features, delivered the roadmap over six months as the sole engineer, and mentored two juniors.

**Senior Software Engineer** | [AllFactors](#) | Santa Clara, CA

July 2022 – Dec 2023

- Rebuilt a slow legacy real-estate analytics app (ASP.NET Web Forms) as a modern Blazor WebAssembly front end, roughly halving page load time and removing the brittle state-management that had made the old app hard to change.
- Built a real-time market-data pipeline (SignalR + SQL Server change tracking) that streamed live pricing and inventory to hundreds of concurrent users with sub-second updates.
- Created a reusable component library of data grids, charts, and filters that became the standard building blocks for the product's dashboards, and added automated tests that caught regressions before release.

**Software Engineer** | [Smart Meal Service](#) | Russia

Sep 2020 – Oct 2021

- Built the software for a self-service food kiosk and robotic cashier in C# / .NET, talking to real payment terminals and hardware over low-level protocols, plus the customer ordering app (Xamarin) and an admin dashboard (ASP.NET Core + Angular).
- Added automated order routing that noticeably cut kitchen wait times, and a hardware abstraction layer so one codebase ran across three machine models.

- Built the multiplayer networking for a VR smart-city simulation in Unity, keeping many users in sync in real time, plus spatial audio, hand-tracking, and a desktop spectator client so people without a headset could watch and take part.
- Automated the art pipeline (model import, level-of-detail generation, lighting bakes), turning a multi-hour per-scene chore into a quick one.

*Earlier:* Game Developer at EC Dev Team, Uzbekistan (2016 to 2019), led RTS game development in the Clausewitz Engine. Freelance Developer at Freelancer.com (2019 to 2020), building .NET and Python NLP applications.

## FEATURED PROJECTS

---

### LogisticsX

<https://logisticsx.app> | [GitHub](#)

*.NET 10, EF Core, MediatR, SignalR, Angular 21, Kotlin KMP, PostgreSQL, Claude API, Stripe, Docker*

- Built an AI dispatcher that matches freight loads to trucks, checks federal driver hours-of-service rules, and plans multi-stop routes on its own, turning a manual 15-minute decision into a near-instant one (Claude API, custom tool-use agent).
- Shipped the full product: four web portals (admin, dispatcher, customer, broker), a cross-platform Android/iOS driver app, and a multi-tenant .NET backend integrated with the major freight load boards and truck-tracking providers (DAT, Truckstop, Samsara, Motive) plus Stripe payouts.

### Meat.gg

<https://meat.gg>

*ElysiaJS, Next.js, PostgreSQL, Prisma, Bun, C++23, Metamod:Source 2, Docker, Stripe*

- Launched a community platform for Counter-Strike 2 servers that grew to 50K+ registered users, with player profiles, messaging, a friends system, and a Stripe-backed cosmetics shop.
- Wrote a native C++ game-server plugin connecting the live game servers to the web backend, so admins can ban, report, and moderate players from inside the game in real time.

### OGStack

<https://ogstack.dev> | [GitHub](#)

*Next.js 16, Elysia, Bun, PostgreSQL, Prisma, Satori, Cloudflare R2, Stripe, Docker*

- SaaS that automatically creates on-brand social-share preview images for any web page from a single line of markup, served from a global CDN. It generated 10K+ images during the beta.
- Built the engine behind it: a layer that routes work across several AI models (Claude, GPT, DeepSeek) to read a page and match its branding, plus AI background generation and an HTML-to-image renderer, billed through Stripe.

### DepVault

<https://depvault.com> | [GitHub](#)

*Next.js, ElysiaJS, PostgreSQL, Prisma, Bun, .NET AOT CLI, Docker*

- Tool that scans a project's software dependencies for known security vulnerabilities across eight language ecosystems (npm, PyPI, NuGet, Cargo, Maven, and more) and doubles as an encrypted vault for secrets, with a CLI for injecting tokens into CI/CD pipelines. The scanner checks a thousand-plus dependencies per project in seconds.

### Med Image Scanner

<https://github.com/suxrobgm/med-image-scanner>

*FastAPI, Next.js, PyTorch, OpenCV, OHIF Viewer, PostgreSQL*

- HIPAA-compliant platform that pulls X-ray, CT, and MRI scans straight from hospital imaging systems and runs deep-learning models to flag findings (pneumonia on chest X-rays, brain bleeds on head CTs), drawing the results as overlays a radiologist can review.

### Bookshelf Scanner

<https://github.com/suxrobgm/bookshelf-scanner>

*YOLO, Moondream2 LLM, FastAPI, Angular*

- Computer-vision pipeline that takes a photo of a bookshelf, detects each individual book spine, reads the title and author off each one with a vision-language model, and exports the recognized library to Goodreads or LibraryThing.

### MelanomaNet

[GitHub](#) | [Paper](#)

*PyTorch, EfficientNet V2, GradCAM++, OpenCV*

- Published arXiv research on explainable AI for skin-cancer detection: a deep-learning classifier (roughly 86% accuracy) paired with heatmaps broken down along the ABCDE criteria dermatologists already use, making the model's reasoning legible.
