Summary

Most of my work is web and SaaS products in .NET and TypeScript. I like owning a feature from the schema to the screen and sticking with it after launch, since that's when you find out how people really use it. I also build things on my own time, and a few of those side projects are now live products with real users, so I also handle what comes after the code, like hosting, payments, and keeping them running.

Technical Skills

Languages: C#, TypeScript, Python, C++, Kotlin, JavaScript

Backend: ASP.NET Core, EF Core, SignalR, MediatR, Node.js, NestJS, ElysiaJS, Bun, FastAPI

Frontend & Mobile: React, Next.js, Angular, Blazor, Tailwind CSS, Kotlin Multiplatform, .NET MAUI, React Native

Data: PostgreSQL, SQL Server, MongoDB, Redis, DynamoDB, Firebase, Prisma

AI/ML: PyTorch, TensorFlow, OpenCV, YOLO, Claude/GPT/DeepSeek APIs, MCP, tool-use agents

Game Dev: Unity, Godot, PhaserJS, Colyseus, Metamod:Source 2

Cloud & DevOps: AWS (Amplify, S3, Lambda, Cognito), Azure, Cloudflare, Docker, Kubernetes, GitHub Actions

Professional Experience

Generative AI Engineer | Sidebench | Los Angeles, CA *Jun 2026 – Present*

- Build proofs of concept that test whether off-the-shelf image and language models can do a client's job before the client commits to building it.
- Cosmetic surgery previews: a pipeline that runs facelift, rhinoplasty, eyelid and BOTOX edits on face photos through hosted and self-hosted image models. Landmark masks keep each edit inside the treated area, and ArcFace checks the person still looks like themselves.
- Social stories for autistic children: compared image models and LLMs for illustrating and writing the stories, with automated checks against a draft content standard and a human rubric.
- Both are Python evaluation harnesses with resumable runs, per-call cost tracking, and reports that show every result, failures included.

Software Engineer | EmTech Care Labs | Portland, ME *Jan 2025 – Jun 2025*

- Lead engineer on a HIPAA-compliant Alzheimer's care app on AWS. More than 200 caregivers and patients use it for messaging, push notifications, and shared care plans.
- Merged three web and mobile codebases into one TypeScript monorepo with a shared component library.
- Built the security layer (encrypted patient data, audit logs, role-based access). An outside HIPAA readiness review found no critical issues.
- Planned features with clinicians, shipped the six-month roadmap solo, and mentored two junior engineers.

Software Engineer | AllFactors | Santa Clara, CA *Oct 2021 – Dec 2024*

- Moved a legacy ASP.NET Web Forms real-estate analytics app to Blazor WebAssembly. Page loads got about twice as fast.
- Built the live market-data feed on SignalR and SQL Server change tracking, which pushed updates to hundreds of concurrent users in under a second.
- Wrote the Blazor component library behind every dashboard (grids, charts, filters) and the tests that cover it.

Software Engineer | Smart Meal Service | Russia *Sep 2020 – Jul 2021*

- Wrote the C# software that ran a self-service food kiosk and a robotic cashier, including the payment-terminal and hardware protocols.

- Built the customer ordering app in Xamarin and the admin dashboard in ASP.NET Core and Angular.
- Added a hardware abstraction layer so one codebase covered all three machine models, and automated routing of orders to kitchen stations.

Game Developer | Pentalight Technology | Malaysia *Mar 2020 – Feb 2021*

- Built multiplayer networking, spatial audio, and hand tracking for a VR smart-city simulation in Unity, plus a desktop client for spectators without a headset.
- Automated the art pipeline (model import, LOD generation, lighting bakes). Scene builds that took hours of hands-on work became jobs an artist could start and leave.

Before that: freelance .NET and Python NLP work (2019 – 2020), and three years as a game developer at EC Dev Team in Uzbekistan (2016 – 2019), where I led an RTS mod on Paradox's Clausewitz engine.

Education

Northeastern University, M.S. in Computer Science, GPA 4.0, Boston, MA *Jan 2024 – May 2026*

Suffolk University, B.S. in Computer Science, Cum Laude, Boston, MA *Sep 2021 – May 2023*

Featured Projects

LogisticsX https://logisticsx.app | GitHub

.NET 10, EF Core, MediatR, SignalR, Angular 21, Kotlin Multiplatform, PostgreSQL, multi-provider LLMs, Stripe, Docker

- Trucking management system with an AI dispatcher built on tool-calling LLMs from several providers. It matches loads to trucks, checks federal hours-of-service rules, and plans multi-stop routes.
- A multi-tenant .NET backend serves four web portals (admin, dispatcher, customer, broker) and an Android/iOS driver app.
- Integrates with DAT, Truckstop, Samsara, and Motive; payouts go through Stripe.

Meat.gg https://meat.gg

ElysiaJS, Next.js, PostgreSQL, Prisma, Bun, C++23, Metamod:Source 2, Docker, Stripe

- Community site for Counter-Strike 2 servers with 50K+ registered users. Players get profiles, friends, messaging, and a cosmetics shop on Stripe.
- Wrote a native C++ plugin (Metamod:Source 2) that connects live game servers to the web backend, so admins can ban, review reports, and moderate from inside the game.

DepVault https://depvault.com | GitHub

Next.js, ElysiaJS, PostgreSQL, Prisma, Bun, .NET AOT CLI, Docker

- Scans dependencies for known vulnerabilities in eight ecosystems, including npm, PyPI, NuGet, Cargo, and Maven. A project with 1,000+ dependencies takes seconds.
- Doubles as an encrypted secrets vault; a .NET AOT CLI injects tokens into CI/CD pipelines.

MelanomaNet GitHub | Paper

PyTorch, EfficientNet V2, GradCAM++, OpenCV, ISIC 2019

- Skin-lesion classifier (EfficientNet V2, nine classes, 0.86 weighted F1) whose GradCAM++ heatmaps are tied to the ABCDE checklist dermatologists use. Preprint on arXiv.
